### **The Brady-Euro Yield Differential Debate: Why Arbitrage is Infeasible**

Prepared by Elaine Buckberg and Federico Kaune<sup>1</sup>

Authorized by Steven Dunaway

November 1996

#### **Abstract**

Brady bonds offer substantially higher returns than Eurobonds. This paper examines the Brady and Eurobond markets for developing country debt and finds that the apparent arbitrage opportunity is not only smaller than it at first appears, but is infeasible given the illiquidity of the Eurobond market. The maturity adjusted return differential between Brady and Eurobonds is smaller than the commonly cited yield spreads. Moreover, the transactions costs of executing a Eurobond short contract render arbitrage a loss-making proposition. Given the many crossover investors who are active in both the Brady and Euro markets, why do Eurobond investors not trade them actively?

## Summary

A look at yields on developing country debt instruments reveals that Brady bonds offer substantially higher returns than Eurobonds from the same issuer, signaling an unexploited profit opportunity. The quoted yield differential is particularly striking using the "stripped" yields on Brady bonds--the yield on the country-specific risk component if it could be separated from the yield on underlying U.S. Treasury bond collateral. For example, on October 19, 1994, new five-year maturity Eurobonds issued by the Republic of Argentina sold at an average yield of 10.97 percent, while on the same day Argentinean discount Brady bonds with 28 years to maturity traded at a stripped yield of 14.60 percent. The striking thing about these yield differentials is that no one seems to be stepping in to arbitrage the differentials away.

This paper examines the Brady and Eurobond markets and concludes that there is less potential for arbitrage than may appear. Moreover, the paper shows that illiquidity in the Eurobond market would prevent the exploitation of even this narrower arbitrage opportunity.

The Brady-Eurobond yield differential shrinks substantially if you compare the appropriate yields. The average spread between blended Brady bond yields (the simple yield of both the collateralized and uncollateralized components) and Eurobond yields is 78 basis points for discount bonds and 19 for par bonds, versus 344 and 246 basis points respectively for stripped yields. Accounting for maturity differentials between the Eurobonds, most of which mature in two to five years, and Bradies, most of which have roughly 25 years to maturity, narrows the yield differential yet more.

A puzzle remains: why does the secondary Eurobond market remain inactive? The market could become liquid if several large institutional investors stepped in simultaneously and began trading actively, serving as market makers. The explanation may lie in coordination failure.

## I. INTRODUCTION

A look at yields on developing country debt instruments reveals a bifurcation between the Brady bond and Eurobond markets. Brady bonds offer substantially higher returns than Eurobonds from the same issuer, signaling an unexploited potential profit opportunity. The quoted yield differential is particularly striking using "stripped" yields on Brady bonds--the yield on the country-specific risk component if it could be separated from the underlying U.S. Treasury bond collateral yield. For example, on October 19, 1994, new five-year maturity Eurobonds issued by the Republic of Argentina sold at an average yield of 10.97 percent, while on the same day Argentinean discount Brady bonds with 28 years to maturity traded at a stripped yield of 14.60 percent. The striking thing about these yield differentials is that no one seems to be stepping in to arbitrage the differentials away. This paper examines the Brady and Eurobond markets for developing country debt and concludes that there is less potential for arbitrage than may appear. Moreover, the paper shows that illiquidity in the Eurobond market would prevent the realization of even this narrower arbitrage opportunity.

The yield differential between Brady and Eurobonds shrinks substantially if you compare the appropriate yields. On Brady bonds, it is necessary to consider the blended or simple yield of both the collateralized and uncollateralized components. Then it is necessary to account for the maturity differentials between the Euros, which typically have maturities of five years or less, and the Bradies, which currently have maturities of 23 to 30 years.<sup>2</sup> Examining a yield curve for Eurobonds shows a very high term premium, such that even ten-year maturity bonds have yields very close to blended Brady yields. The smaller maturity-adjusted yield differential raises questions about the feasibility of arbitrage. Shorting Euros is very risky, because of the illiquidity in the Eurobond market. The paper will examine each argument in detail, using data on bonds issued by Argentina, Brazil, Mexico, and Venezuela.

## II. THE BRADY-EURO DEBATE AND POPULAR REASONING

A survey of bond traders will yield a variety of arguments for why Brady bonds do and should offer higher yields. However, many of these arguments run contrary to what standard analysis would suggest. Many market participants argue that Brady bonds offer higher yields because the bonds' prices are excessively volatile, due to the market's high liquidity. But, normally, it is expected that investors will accept a lower return in order to obtain a higher degree of liquidity. Eurobonds offer very stable prices exactly because Eurobonds rarely trade. The price is assumed to remain flat at the most recently quoted transaction price (often the issuing price); the shadow price of the bond, though, may be volatile because it is likely that an attempt to trade in that issue would move the price substantially.

Traders also often argue that Brady bonds require higher yields because governments are perceived as more likely to default on Brady bonds than on other liabilities. However, the substantial collateralization of Brady bonds makes them more secure than other liabilities, including Eurobonds. Both par and discount Brady bonds, the largest and most common

---

<sup>2</sup>The earliest Brady debt restructuring operations that included the issuance of new bonds were completed by Costa Rica and Mexico in 1989.

issues in the Brady bond market, are typically collateralized with respect to principal at maturity by U.S. Treasury zero-coupon bonds.<sup>3</sup> In addition, both par and discount bond interest payments are often collateralized for a fixed number of months (usually 12 months). The collateral account is designed to ensure that, should the debtor country miss one or two interest payments, the obligations could be met out of the collateral. The underlying idea is that a country's problems that might cause it to miss payments should be able to be resolved within the period covered by the cash collateral. In contrast, Eurobonds are rarely collateralized with respect to either principal or interest.

Because Eurobonds are so illiquid, there exist regular price series for very few Eurobond issues, raising data problems for this paper's analysis. Brady prices, in contrast, are available daily. We constructed an intermittent Eurobond yield series using the average yield at launch for sovereign other public sector and private sector Eurobonds from Argentina, Brazil, Mexico, and Venezuela, for 1993 to the first quarter of 1996. Eurobond yields are then matched with the same day's Brady par and discount bond yields, as the par and discount bonds tend to be the largest and most actively traded issues. Argentina, Brazil, Mexico, and Venezuela were selected because their Brady bonds are among the most liquid, and they were also relatively active issuers in the Eurobond market. We start in 1993 as this year marks a significant upswing in Eurobond issuing activity.<sup>4</sup> This approach yielded 243 observations: 78 for Argentina, 83 for Brazil, 70 for Mexico, and 12 for Venezuela.

The paper will focus on yield spreads so as to remove world interest rate fluctuations over the sample period. Using spreads also enables us to maximize the number of data points because for many floating rate Eurobonds we can calculate spreads but not yields.

### III. WHY THE TRUE BRADY BOND YIELD IS THE BLENDED YIELD

To facilitate the comparison of yield differentials between different countries' Brady bonds, which carry different amounts of collateralization, the stripped yield or stripped yield

---

<sup>3</sup>Par bonds are fixed-rate bonds for the original face value of the loans for which they were exchanged; an effective reduction in the commercial bank debt exchanged for these bonds stem from the below-market rates of interest that they pay. Discount bonds pay a floating market interest rates but are issued at a discount to the face value of the original loans. There also exist classes of uncollateralized Brady bonds: debt conversion bonds (DCBs), new money bonds (NMBs), front loaded interest reduction bonds (FLIRBs), and capitalization bonds (C-bonds). DCBs, NMBs, and FLIRBs are shorter in maturity and are less actively traded in secondary markets than par and discount bonds. All lack principal collateral and only the FLIRBs have collateralized interest payments. Capitalization bonds, used by Brazil, are 20-year issues with back loaded payments.

<sup>4</sup>Total international bond issues by developing countries rose from \$24 billion in 1992 to \$63 billion in 1993.

spread is often quoted. The stripped yield represents the yield on the risky component of the bond, i.e., the yield on the bond less the yield on the underlying collateral. While the stripped yield is useful to compare the price of country risk across similar assets, for most Brady issues it is not a realizable yield in the market because the bonds cannot be stripped. First, there is no market where a 30-year Treasury bond can be shorted for its full 30-year maturity. A 30-year Treasury bond can be shorted for exactly one year through the repo market; in order to "short" a 30 year Treasury, one would have to return to the repo market every year, and would face risk in the volatility of 30-year Treasury bond yields. As such, a true shorting or stripping strategy is not possible owing to the fact that one does not know at the outset the 30 year cost of the strategy. Second, most institutional investors in the Brady market (with the exception of hedge funds) cannot earn the stripped yield even over short periods because they are prohibited from holding short positions. In principle, those investors who treat Bradies as short-term assets, purchasing them with the intention of reselling them within a year, could earn the stripped yield by shorting the underlying U.S. Treasury bond. In practice, they can only earn the blended yield.

Thus, for the purpose of making an investment decision, the relevant comparison is between the simple (nonstripped) yield on a Brady bond and that on another asset. Unstripped yield spreads are on average 269 basis points lower than stripped yield spreads for discount bonds, and 220 basis points lower for par bonds, as shown in Chart 1. The average differential between (blended) Brady discount and Eurobond spreads is 78 basis points, as shown in the tabulation below; for Brady par bonds, the yield spread differential with respect to Eurobonds is 19 basis points. This is substantially narrower than the average 344 basis point difference between the stripped yield on Brady discount bonds and Eurobonds and 246 basis point difference between the stripped yield on Brady par bonds and Euros. (For complete data, see Tables 1 and 2.)

Yield Spreads on Selected Brady and Eurobonds

(Spreads for the issue date of a recent Eurobond release for each country;  
spreads in basis points calculated relative to comparable-maturity U.S. Treasury issue)

| Mexico                                                  | 6/15/95 | 1,048       | 553     | 883      | 488     | 524       | 3        |
| Venezuela                                               | 9/10/93 | 646         | 288     | 535      | 306     | 292       | 2        |
| Sample mean spread between<br>Brady bonds and Eurobonds |         | 344         | 78      | 246      | 19      |           |          |
| Sample max                                              |         | 1,188       | 648     | 1,163    | 586     |           |          |
| Sample min                                              |         | -269        | -429    | -359     | -489    |           |          |

A few Brady deals--Argentina, Brazil, Ecuador, and Poland--generated pre-stripped, zero collateral issues. In these cases, the simple yield reflects pure country risk and is also the relevant price for investment purposes. Naturally, though, these bonds should offer higher yields as they are uncollateralized.

#### IV. ACCOUNTING FOR MATURITY DIFFERENTIALS

Another problem associated with comparing Brady and Eurobond yields is that the differential includes a yield premium associated with the Brady bonds' longer maturity. Eurobonds typically average two to five years in maturity, although occasionally developing countries issue at maturities as long as 10 years. Maturity differentials can be partially removed by comparing yield spreads relative to comparable-maturity Treasuries, thereby removing the yield premium on Treasuries. However, comparing spreads will fully correct

(and even then imperfectly) for maturity differences only if the yield premium is constant in basis points (not proportionally) across risk classes.<sup>5</sup>

Term premiums on risky developing country sovereign debt, however, tend to be higher than on U.S. Treasury bonds (which are often used to proxy a risk-free yield). If the term premium were equal on developing country and Treasury bonds, then the yield spreads on two-year Eurobonds and on ten-year Eurobonds would be equal, i.e., if two-year Argentinean Eurobonds offered a 200 basis point premium over two-year Treasury bonds, then ten-year Argentinean Eurobonds and 30-year Argentinean Brady bonds would also offer a 200 basis point premium over comparable maturity Treasury bonds. The yield spread on discount Brady bonds, however, is on average 420 basis points higher than the yield spread on two-year maturity sovereign Eurobonds, but only 300 basis points higher than on five-year maturity sovereign Euros and 115 basis points higher than on 10-year sovereign Euros (see Chart 2). Comparing Eurobonds with Brady par bonds, the spread differential declines from 310 basis points on two-year Euros to 210 basis points on 5-years and 45 basis points on 10-years (see Chart 3).<sup>6</sup> The shrinking spread differential suggests that much of the return premium on Brady bonds is attributable to their longer maturity. Further, the declining spread differential indicates that the yield premium is rising, not constant, across risk classes; as such, comparing spreads does not adequately correct for maturity differences.<sup>7</sup>

## V. IS THERE AN EXPLOITABLE ARBITRAGE OPPORTUNITY?

Are there still profits to be made arbitraging Brady and Euro bonds from the same issuers, based on unstripped Brady bond yields and after accounting for maturity differentials? As indicated above, there remains a 50 to 100 basis point yield spread premium on Brady bonds over 10 year maturity Eurobonds--generally, more than enough to make arbitrage worthwhile. Transactions costs, however, would more than wipe the yield differential out--rendering arbitrage a loss-making proposition. We explain why below.

Consider the mechanics of establishing a long-short fund to arbitrage the Brady-Euro yield differentials. The simple option would be to go long in (unstripped) Brady bonds and short an equal amount of Eurobonds for each country, choosing between the various Brady

---

<sup>5</sup>Arbitraging duration differentials may be an equally important, or even greater, concern for some investors, and their impact on yields should be examined in future work.

<sup>6</sup>A similar correlation between spreads and maturities has been observed (for developing country issues) in the Samurai bond market.

<sup>7</sup>See Appendix I for the econometric procedure and results.

and Eurobond issues available.<sup>8</sup> As most Eurobonds are relatively short in maturity (two to five years) you will have to be willing to accept a mismatch of maturities in your portfolio. The high liquidity of the Brady bond market, however, means Brady bonds are effectively short-term assets--you will not need to hold them to maturity--so this should not be a problem.

The problem lies in executing the Eurobond short contracts. A short contract will sell at a discount relative to the underlying bond price; the discount or financing fee in an illiquid market like the Eurobond market would typically be between 200 and 400 basis points. The fee alone, therefore, would more than wipe out the Brady-Euro spread. The fee reflects risks involved in executing the short contract. If one of the holders of your short contracts decides to call the contract, you will need to purchase the shorted Euros on little notice. As Euros are very illiquid, as discussed above, you are likely to raise the price with your purchase order; in particular, an institutional-sized purchase may move the market substantially. However, your purchases will necessarily be large, such that the trade may not even be feasible. The minimum purchase in the Brady bond market is generally \$250,000. Because Eurobond issues are typically far smaller and you will want to limit the extent that you would move the market by secondary trade, you will likely want to spread your short contracts across as many Eurobonds as possible. If five different Eurobond issues are available to short against your Brady purchase, you will need to purchase \$50,000 of each--a large sum in a secondary market with minimum purchases of \$1000. As such, you are likely to move prices in the Eurobond market both when you short the bonds and when you actually purchase bonds to close the short contract. When Eurobond prices are quoted, the bid-offer spread is often as much as 200 basis points and even seeking bids can move the price.

## VI. ILLIQUIDITY IN THE EUROBOND MARKET: A PARADOX

The apparent arbitrage opportunity is made infeasible by the illiquidity of the Eurobond market. This raises questions as to why the Eurobond market continues to be so illiquid. Stated alternatively, why do the many investors who hold Eurobonds not trade them actively? Eurobonds are held by mutual funds, insurance companies, money managers, pension funds, and banks--all of whom are also active in the Brady bond market.<sup>9</sup> This crossover would seem to refute the often cited argument that the Brady and Eurobond markets are segmented by the different trading volumes, with \$250,000 minimums in the Brady market against \$1000 minimums in the Euro market. The Eurobond market could become active if a handful of institutional investors simultaneously decided to play actively, serving as market makers.

---

<sup>8</sup>A more complex option would be to come as close as possible to stripping the Brady bonds by shorting 30-year U.S. Treasury bonds in the repo market for a year at a time, every year. Since it is hard to put a cost on the stripping process, we will focus on the simple option.

<sup>9</sup>However, anecdotal evidence indicates that these institutional investors are increasingly shying away from the Eurobond market on the grounds that the yields are inadequate.

Moreover, it would seem that sovereign Eurobond issues are adequately large in relation to the sums institutional investors want to transact: over 1993-95, the average Eurobond issue totaled \$210 million, larger than many issues in the U.S. corporate and municipal bond markets. Suppose that half of the issue is immediately bought by European institutional and individual investors, none of whom trade actively. This leaves \$105 million held by potentially active traders. A transaction of \$250,000 would represent only 0.24 percent of the value of the typical issue. Furthermore, Eurobond issues have been growing, with average issue amounts climbing from \$186 million in 1993 to \$254 million in 1995.

Nonetheless, the participation of European institutional and individual investors does seem to matter. Recently, some investment firms have begun selling Brady derivatives, including shorter-term, bullet maturity bonds purchasable in retail quantities. These derivative bonds, with terms much like Eurobonds, sell at Eurobond like yields, suggesting that retail investors may have an important role in determining the yield on Eurobonds.

## VII. CONCLUSION

We have shown that the maturity-adjusted return differential between Brady and Eurobonds is smaller than commonly cited. Moreover, under current market conditions, it does not appear feasible to profitably arbitrage the quoted return differential, due to the illiquidity of the Eurobond market and the resulting expense of transacting in this market. A puzzle, however, remains: why does the secondary Eurobond market remain inactive? The market could become liquid if several large institutional investors stepped in simultaneously and began trading actively, serving as market makers. The explanation may lie in coordination failure, or may lie elsewhere.

Chart 1.

- \* Spread on excess returns of stripped *discount* Brady bonds with respect to Eurobonds (in basis points). Excess returns are defined with respect to U.S. Treasury instruments of comparable maturity. Maturity refers to the term to maturity of Eurobonds (Years).

- \* Spread on excess returns of stripped *par* Brady bonds with respect to Eurobonds (in basis points). Excess returns are defined with respect to U.S. Treasury instruments of comparable maturity. Maturity refers to the term to maturity of Eurobonds (Years).

APPENDIX I

The basic relationship estimated in this paper is:

$$(r_j^{Brady} - r^{Euro})_i = \alpha + \beta M_i^{Euro} + \epsilon_i$$

where i = Argentina, Brazil, Mexico, Venezuela, and j = stripped discount bonds, non-stripped discount bonds, stripped par bonds, non-stripped par bonds. The terms  $r^{Brady}$  and  $r^{Euro}$  are the yield spreads of Brady bonds and Eurobonds with respect to U.S. Treasury instrument yields with comparable maturity (expressed in basis points). Brady bonds' yields were selected to match the Eurobond date of issuance and country of issuance.  $M^{Euro}$  is the term to maturity of a Eurobond at the issuance date (expressed in years). The main results are summarized in the table below.

Regression Results of Excess Returns Spreads  
onto Term to Maturity of Eurobonds

| Brady Bonds          | Constant          | Slope            | R2   | F     |
|----------------------|-------------------|------------------|------|-------|
| Stripped discount    | 495.82<br>(32.17) | -37.91<br>(6.87) | 0.09 | 24.87 |
| Nonstripped discount | 158.78<br>(21.61) | -20.06<br>(4.52) | 0.06 | 15.81 |
| Stripped par         | 380.66<br>(28.05) | -33.59<br>(6.11) | 0.09 | 24.14 |
| Nonstripped par      | 88.16<br>(19.75)  | -17.32<br>(4.23) | 0.06 | 13.92 |
